What is Aries proposing for Taunton?

Conservation Law Foundation protects New England's environment for the benefit of all people.

We use the law, science, and the market to create solutions that preserve our natural resources, build healthy communities, and sustain a vibrant economy.

Aries proposes to:

- Build a sewage sludge* treatment facility in the City of Taunton
- Use gasification to process the sewage sludge

* The waste industry uses greenwashing language to make things sound less harmful. For example, Aries refers to sewage sludge as "biosolids."

The facility would...

- Take in up to 500 tons of sewage sludge per day
- Produce 46 truck trips to/from the facility a day
- Generate 100,000 gallons of wastewater per day
- Send air emissions through a 127+ foot high stack
- Produce 25 tons of ash* per day
- * Aries refers to ash with the greenwashed term "biochar."

The facility would...

- Sell ash for use in production of cement, concrete, and soil amendment
- Sell dried sewage sludge when gasifier is not operating for use as fertilizer and soil remediation

What is sewage sludge?

- Sewage sludge is the solid or semi-solid leftovers from wastewater treatment plants
- Sewage sludge is contaminated with substances like steroids, hormones, pharmaceuticals, metals, flame retardants, microplastics, and PFAS
- Sewage sludge can be class A or class B depending on whether the treatment method removed pathogens

Aries claims that...

- The facility will destroy toxics like *PFAS* through high temperature gasification
- The facility won't discharge toxics like *PFAS* into the air, soil, or water
- Its special technology, something called "fluidized bed gasification," can accomplish this

What is gasification?

- Gasification is the high heat, low oxygen processing of waste
- *Gasification* is similar to incineration, but it's broken into two parts:
 - 1) Waste is heated in oxygen-poor environment to create synthetic fuel (ash is also a biproduct)
 - Synthetic fuel is burned in an oxygen-rich environment (leaving ash as biproduct)

FLUIDIZED BED GASIFICATION
